**Fig. S4.** Resistance of PAO1 and PAO1ΔeftM to complement-mediated killing. PAO1 and PAO1ΔeftM were grown to mid-log phase at 25°C or 37°C and treated for 60 min in 20% normal human serum. The percentage of survival is the number of cfus remaining when compared with controls in which complement activity was heat-inactivated. Three independent experiments each done in triplicate were performed. Errors bars represents SEMs.
